!

PREVENTION

Adopting a dog from Nunavik requires being
informed and exercising caution. Even if a
dog appears healthy, it can develop
symptoms of rabies up to six months after
infection. The ownerʼs permission and
appropriate safety measures are essential
before adoption.

Vaccinate your dogs. Rabies vaccination protects dogs
and helps prevent the spread of the virus to people.
Contact your municipality for information on upcoming
dog vaccination clinics.

ᐁᑦᑐᑕᐅᓂᖅ ᓴᐳᒻᒥᓯᐊᕋᓱᐊᕐᓂᒧᑦ

Rabies is transmitted from a mammal (e.g., fox or
dog) through a bite, scratch, or through contact
of saliva with a fresh wound or a mucous
membrane (eyes, nose, mouth).

TRANSMISSION PROTECTION

Rabies is fatal, but it can be prevented with quick action.
Preventive treatment can be given after a bite, scratch, or
contact with the saliva of an animal.

Any exposure must be taken seriously.
If a person is bitten, scratched, or has come into contact with an animalʼs saliva:

• Wash the wound with soap and water for 10 to 15 minutes
and seek medical care quickly at the CLSC / Nursing Station;
• Do not kill the animal, as it must be observed to assess the
risk of rabies.
