POSSIBLE REACTIONS TO THE VACCINE

Fever, redness on the skin and red eyes.

Pain, redness, small sore at the injection site.

Swollen lymph nodes in the armpit or above the collarbone on the injection site.

Small red bump containing fluid may appear 2 to 4 weeks after the vaccine. It can take 2 to 5 months before disappearing and may leave a small scar.

In rare cases, an allergic

reaction or a general

infection may develop.

These reactions are extremely rare and the benefits of vaccination outweighs the risks significantly.

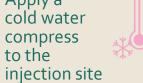

Wash the

baby's arm

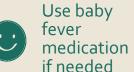

normally

a gauze

forms

DO NOT burst the small blister if it develops

DO NOT apply ointment or cream

DO NOT apply an adhesive bandage to the wound

(e.g. Band-Aid)

BCG

Everything You Need to Know

Information destined for parents concerning the **Tuberculosis** vaccine (BCG)

BCG IS A VACCINE ...

That protects children from tuberculosis, especially severe forms of the disease.

Offered to all one-month old infants in Nunavik, since January 2023.

WHAT IS **TUBERCULOSIS**

It is a contagious disease caused by bacteria.

It mostly affects the lungs, but can also affect other parts of the body (bones, brain, kidneys, etc).

TUBERCULOSIS

It can cause serious complications and even be fatal.

BCG VACCINE

BCG is safe

It can sometimes cause mild reactions that go away on their own.

BCG is not recommended for some children with severe immune system problems.

Before receiving **BCG**, an assessment is done to make sure your child is eligible:

A test for severe combined immunodeficiency (SCID) is offered at birth

A Tuberculin Skin Test (TST) may also be recommended

If you have any questions or notice symptoms, contact your CLSC/Nursing Station.
